

Why we use the INSiGHT™ spinal nerve scanning technology in our office

Our office uses the INSiGHT™ neuro-spinal scanning system to detect and monitor hidden tension within the spinal core. These damaging stress patterns, known as subluxations, affect your spine and impact overall health and wellness.

Because subluxations are a mostly silent process, symptoms and pain may not occur until after some initial damage has been done. Your body was made to heal itself, and when a subluxation occurs, it cannot properly do so! These advanced sensing technologies are essential for screening our patients and their family's nervous systems so that we can recommend the most effective care and share our professional and trusted advice.

We are committed to promoting a drug-less approach in family healthcare while awakening the natural, healing potential in each of our patients .
